                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ठे
                                                                                                                                        expression vector construct containing the vacular endothelial growth factor 2 (VBGF-2) insert. The nucleic acid is useful for producing a host cell by transducing, transforming or transfecting a host cell with the DNA and for treating a patient having chronic limb ischaemia or myocardial ischaemia, or a disease or disorder selected from autoimmune disorders (e.g. rheumatorid arthritis, dermatitis), allergic reactions or conditions (e.g. asthma), organ rejection, inflammatory conditions (e.g. crohn's disease), hyperproliferative disorders (e.g. Gaucher's disease), diseases due to viral, bacterial, fungal or parasitic infection, cardiovascular disorders (e.g. cardiowascular disorders (e.g. cardiowascular disorders and embolism. This sequence represents the pVGI.1 expression vector containing the VBGF-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180

```
The present sequence is a promoter element derived from the cytomegalovirus (CWV) immediate early promoter. The promoter the promoter element is used to achieve persistent expression of an operably linked transgene, especially human cystic fibrosis transmembrane conductance regulator especially human cystic fibrosis transmembrane conductance regulator expression of the man alpha-galactostidase gene, in a target cell. The expression cassette comprising the promoter element operably linked to a transgene is delivered to a target cell via a plasmid or an adenoviral vector lacking the B4 region. As the promoter element functions independently of the viral E4 region, this allows the use of vectors containing reduced viral genomes thereby increasing the carrying capacity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        containing reduced viral genomes thereby increasing the carrying capacity of the vector while decreasing the potential for host immune reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      136

ABD17575 to ABQ20506 represent isolated polynucleotide (I) sequences, and ABP54446 to ABB54472 represent protein (II) sequences, from the present invention. (I) and (II) have cytostatic activity and can be used in gene therapy and vaccines. (I), (II), antibodies and compositions from the present invention are useful for diagnosing, preventing and treating cancer, which expresses CT or CP mRNA antigens. They are useful for stimulating immune response. They can also be useful in virology, incrobiology, molecular biology and recombinant DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        375 TITITGGCAGTACATCAATGGGCGTGGATAGCGGTTTGACTCACGGGGATTTCCAAGTCTC 434

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a promoter element derived from the cytomegalovirus (CMV) immediate early promoter. The promoter element is used to achieve persistent expression of an operably linked transgene, especially human cystic fibrosis transmembrane conductance regulator gene (CFTR gene) or human alpha-galactosidase gene, in a target cell. The stransgene is delivered to a target cell via a plasmid or an adenoviral transgene is delivered to a target cell via a plasmid or an adenoviral independently of the viral E4 region. As the promoter element functions independently of the viral E4 region, this allows the use of vectors containing reduced viral genomes thereby increasing the carrying capacity of the vector while decreasing the potential for host immune reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The compositions of the invention bind to this sequence. The specification describes a composition that comprises low density lipoprotein (LDL) and apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in vivo or in vitro, for expressing a therapeutic polypeptide or antisense molecule (or riboxyme). Specifically they are used for gene therapy of cancers (particularly non-small cell lung carcinoma), diabetes, cystic fibrosis and
                                                                                                                                                                                                                                                                                                                       apolipoprotein; binding; in vivo transport; nucleic:acid; binding dom:

This is the wild-type cytomegalovirus (CWV)-MIE promoter sequence comprising two putative Gfi-1 (growth factor independence-1) transcription repressor binding sites. This promoter can be mutated at the Gfi-1 binding sites to be used in a novel isolated DNA construct which contains at least one mutated binding site for a Gfi-1 to transcription repressor that hinders or prevents binding of Gfi-1 to this site. The expression vector contains an expression regulatory segment that contains at least one copy of the sequences shown in AAV19671 to AAV19685 linked operably to a coding segment selected from a group of cytokines, interleavins, interferons, growth factors and protonocogenes, and an isolated DNA molecule containing one of two 500 base increases expression of these genes controlled by regulators that include binding sites for Gfi-1 both in cultured cells and in vivo (for gene therapy or DNA vaccination). A vector containing a normal gene under control of a regulator with the mutated binding site can be

```
The invention relates to a 5' and a 3' fragment of the chicken beta-actin promoter (AAPS4422 and AAPS4413), respectively), which exhibit promoter activity. The chicken beta-actin promoter fragments may be used to drive expression of a heterologous gene in a recombinant vector used as the active component of a genetic vaccine. The present sequence represents a cytomegalovinus (GWV) immediate-early (IE) promoter aniancer, a portion of which was used in the construction of the chimeric Pec promoter (AAF84454) in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    77 TTTTGGCAGTACATCAATGGGCGTGGATAGCGGTTTGACTCACGGGGATTTCCAAGTCTC 136

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              n = an integer of 5-15;

X 2 = Gly-Ser-Leu or Pro-Leu-Ala,
The signal peptides are useful in the preparation of human growth
hormone and transformed chlorella. Signal peptides, DNA encoding the
hormone expression cassettes, recombinant vectors containing the
cassettes, and transformants having the vectors are provided. The
present sequence is a promoter which may be used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 signal peptides useful for the preparation of human growth hormone transformed chlorella
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is provided in a specification relating to signal peptides for expression and secretion of a protein in chlorella. The peptides are of the formula:

Met-Ala-Asn-Lyg-X_1-(Leu)_n-X_2-Ala-Ser-Gly.

gene expression systems useful for modulating gene expression in host cells. The gene expression system encodes a polypeptide with a DNA-binding domain recognizes a response element associated with a gene whose expression is to be modulated and/or a ligand binding domain (IBD) comprising a IBD from a nuclear receptor and a second gene expression cassette capable of being expressed in a host cell comprising a transpolymucleotide sequence encoding escond polypeptide comprising a transpolymucleotide sequence encoding second polypeptide comprising a transpolymucleotide sequence encoding second polypeptide comprising a transpolymuclear receptor other than an ecdysone receptor, a retinoid X receptor of the TADP (USP) (the transactivation domain is from a nuclear receptor other than an ecdysone receptor, a retinoid X receptor or a USP receptor and the IBDPs from the first and second polypeptides are different and dimerise). The ecdysone and retinoid X receptor based inducible gene expression systems useful for modulating gene expression proteins and antibodies, cell-based high-throughput screening assays (HTS), functional genomic and regulation of traits in transgenic plants and animals. The present sequence represents a cauliflower mosiac virus, CWV, promoter which is used in an inducible gene expression as ystem of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to Ecdysone and retinoid X receptor based inducible

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polypeptides. Compositions comprising the lung tumour polypeptides, polypeptides, fusion proteins, antibodies to the polypeptides, T cell populations, or antigen presenting cells that express the lung tumour polypeptides, are useful for treating lung cancer or stimulating an immune response. The polymucleotides and polypeptides are also useful in the diagnosis and monitoring of lung cancer. Sequences ABK15889-AAS16343 represent CDNA molecules encoding the polypeptides of the invention and PCR primers used to amplify the CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GACTITICCIACTIGGCAGIACAICIACGIATIAGICATCGCIATIACCAIGGTGAIGCGG 337

The method involves introducing a restriction enzyme and a nucleic acid regulatory sequence into mammalian cells - for integrating the nucleic acid construct into the mammalian cell genome at sites generated by the restriction enzyme. Mutant mammalian cells having a trait of interest can then be selected. The method of the invention is useful for isolating a gene controlling a trait of interest from a mammalian cell. The method is useful for discovering and isolating new genes. The method of the invention can be used to create large libraries of mammalian cells which have a low transfection efficiency. The method of the invention is also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     335 gacitirectactificacagracarcracgratragreardectarraceargergarges 394

A method has been developed of increasing prostanoid production in vivo comprising delivering and hyperexpressing a prostaglandin synthase gene in calls. The method can be used for gene therapy. The method is useful for the treatment of diseases such as pulmonary embolus, myocardial infarction and general lung disease (e.g. adult respiratory distress syndrome). Generally the present invention provides a plasmid comprising a cytomegalovirus (GWV) derived promoter sequence driving the coding region for ovinine prostaglandin G/H synthase (PGH). In order to increase translation augmenting sequence and a portion of the 3' untranslated region from the human growth hormone (hGH) gene. The present sequence represents the CMV promoter sequence used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           551

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               In the expression vectors of the invention, the promoter is specifically from the immediate early gene of human cytomegalovirus (CMV) or from simian virus (SV40). The stabilizing SQ contains 1 or 2 splice donor-intron-acceptor SQs, esp. from the specified CMV gene, or the intron is from CMV or the Ig variable region, while the splice-acceptor component corresponds to the Ig acceptor SQ. The vector may also include (upstream of the promoter) an enhancer, esp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Expression vector pF8CSSS contains the cytomegalovirus enhancer and promoter, an engineered stabilising sequence, the cDNA encoding factor VIII and the SV40 polyadenylation site. The entire intron region including donor and acceptor sequences was deleted and replaced by an engineered stabilising sequence. PF8CSSS is used in amethod for prodn. Of a desired heterologous protein in a eukaryotic host cell. The method comprises: transfecting a eucaryotic host cell with a vector conding trans-activating protein; transfecting the host cell with a nexpression vector having a sequence of a ds DNA comprising, an expression vector having a sequence of the desired protein, and a DNA encoding the amino acid sequence of the desired protein, and a polyadenylation sequence upstream to a transcription termination site. The pref. host cells are human embryonic kidney cells (293) or JW2. The method provides useful quantities of a desired protein in a relatively short period of time without having to establish continuous prodn. The transient expression system optimises the interaction between specific vector components and certain trans-activating proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò

The invention is used to manufacture a medicament for inhibiting the proliferation of tumour cells in a mammanian subject. The composition comprising the fusion protein may also be used in treating autoimmune diseases (e.g. systemic lupus crythematosus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CMV enhancer/Myeloproliferative sarcoma virus LTR promoter construct DNA.

AV681509 GKA Homo sapiens cDNA clone GKAAAC02 5', mRNA sequence.
AV681509
               Email: thomas_look@dfci.harvard.edu
The clone was Obtained from an RZPD array made from an adult kidney
CDNA random primed library from Leonard Zon. RZPD library number
576. This clone is available from the Resource Centre/Primary
Database of the German Human Genome Project: RZPD (Ressourcen
Sentrum Primr Datenbank). http://www.rzpd.de
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      589 GACTITICCTACTIGGCAGTACATCTACGTATTAGTCATCGCTATTACCATGGTGATGCGG 530

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Submitted (13-My-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 13, 2003 this sequence version replaced gi:23664519.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.dgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-casffold'). Within each contig-casffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contigs-casffold in the clone and there may be sequence contigs each fold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence contygs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Submitted (24-OCT-2001) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA (bases 1 to 278936)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter.

This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

ON MAY 10, 2003 this sequence version replaced gi:23664548.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.chm.lmc.edu/projects/rat/). Each contrig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.
